---

**COMPUTER SCIENCE****9618/41**

Paper 4 Practical

**May/June 2025****MARK SCHEME**Maximum Mark: 75

---

**Published**

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge International will not enter into discussions about these mark schemes.

Cambridge International is publishing the mark schemes for the May/June 2025 series for most Cambridge IGCSE, Cambridge International A and AS Level components, and some Cambridge O Level components.

---

This document consists of **43** printed pages.

**PUBLISHED****Generic Marking Principles**

These general marking principles must be applied by all examiners when marking candidate answers. They should be applied alongside the specific content of the mark scheme or generic level descriptions for a question. Each question paper and mark scheme will also comply with these marking principles.

**GENERIC MARKING PRINCIPLE 1:**

Marks must be awarded in line with:

- the specific content of the mark scheme or the generic level descriptors for the question
- the specific skills defined in the mark scheme or in the generic level descriptors for the question
- the standard of response required by a candidate as exemplified by the standardisation scripts.

**GENERIC MARKING PRINCIPLE 2:**

Marks awarded are always **whole marks** (not half marks, or other fractions).

**GENERIC MARKING PRINCIPLE 3:**

Marks must be awarded **positively**:

- marks are awarded for correct/valid answers, as defined in the mark scheme. However, credit is given for valid answers which go beyond the scope of the syllabus and mark scheme, referring to your Team Leader as appropriate
- marks are awarded when candidates clearly demonstrate what they know and can do
- marks are not deducted for errors
- marks are not deducted for omissions
- answers should only be judged on the quality of spelling, punctuation and grammar when these features are specifically assessed by the question as indicated by the mark scheme. The meaning, however, should be unambiguous.

**GENERIC MARKING PRINCIPLE 4:**

Rules must be applied consistently, e.g. in situations where candidates have not followed instructions or in the application of generic level descriptors.

**PUBLISHED****GENERIC MARKING PRINCIPLE 5:**

Marks should be awarded using the full range of marks defined in the mark scheme for the question (however; the use of the full mark range may be limited according to the quality of the candidate responses seen).

**GENERIC MARKING PRINCIPLE 6:**

Marks awarded are based solely on the requirements as defined in the mark scheme. Marks should not be awarded with grade thresholds or grade descriptors in mind.

**Annotations guidance for centres**

Examiners use a system of annotations as a shorthand for communicating their marking decisions to one another. Examiners are trained during the standardisation process on how and when to use annotations. The purpose of annotations is to inform the standardisation and monitoring processes and guide the supervising examiners when they are checking the work of examiners within their team. The meaning of annotations and how they are used is specific to each component and is understood by all examiners who mark the component.

We publish annotations in our mark schemes to help centres understand the annotations they may see on copies of scripts. Note that there may not be a direct correlation between the number of annotations on a script and the mark awarded. Similarly, the use of an annotation may not be an indication of the quality of the response.

The annotations listed below were available to examiners marking this component in this series.

**Annotations**

<b>Annotation</b>	<b>Meaning</b>
	Benefit of the doubt
	To indicate where a key word/phrase/code is missing
	Incorrect
	Follow through
	Indicate a point in an answer
Highlighted text	To draw attention to a particular aspect or to indicate where parts of an answer have been combined
	Ignore
	Not answered question
	No benefit of doubt given
	No examples or not enough

Annotation	Meaning
	Not relevant or used to separate parts of an answer
Off-page comment	Allows comments to be entered at the bottom of the RM marking window and then displayed when the associated question item is navigated to.
	Repetition
	Indicates that work or a page has been seen including blank answer spaces and blank pages.
	Correct
	Too vague

**Mark scheme abbreviations**

- **Bold** in mark scheme means that idea is required.
- / in mark scheme means alternative.
- // in mark scheme means alternative solution that gains the same mark point.
- ... at the end of one mark point without a ... at the start of the next just means the sentence follows on. There is no dependency.
- ... at the end of one mark point and ... at the start of the next, this means the second cannot be awarded without the first.
- () means what is in the brackets is not required, or it is not required in some languages but may be required in others.

Question	Answer	Marks
		

Question	Answer	Marks
3(a)(i)	<p>1 mark each</p> <ul style="list-style-type: none"> <li>• Class header (and end where appropriate)</li> <li>• Constructor header (and end where appropriate) with (min) one parameter (integer) within class</li> <li>• 3 attributes with correct data types</li> <li>• <code>NodeData</code> has parameter assigned, <code>LeftNode</code> and <code>RightNode</code> are assigned null within constructor</li> </ul>	4

Question	Answer	Marks
<p>Example program code:</p> <p><b>Python</b></p> <pre>class Node:     def __init__(self, pNodeData):         self._NodeData = pNodeData #integer         self._LeftNode = None #node         self._RightNode = None #node</pre> <p><b>VB.NET</b></p> <pre>Class Node     Private NodeData As Integer     Private LeftNode As Node     Private RightNode As Node     Sub New(pNodeData)         NodeData = pNodeData         LeftNode = Nothing         RightNode = Nothing     End Sub End Class</pre> <p><b>Java</b></p> <pre>class Node{     public Integer NodeData;     public Node LeftNode;     public Node RightNode;     public Node(Integer pNodeData){         NodeData = pNodeData;         LeftNode = null;         RightNode = null;     } }</pre>		

Question	Answer	Marks
3(a)(ii)	1 mark each <ul style="list-style-type: none"> <li>• 1 get method with no parameter ...</li> <li>• ... returning correct value</li> <li>• 2nd and 3rd correct get methods</li> </ul>	<b>3</b>

Example program code:

#### Python

```
def GetLeft(self):
    return self._LeftNode
def GetRight(self):
    return self._RightNode
def GetData(self):
    return self._NodeData
```

#### VB.NET

```
Function GetLeft()
    Return LeftNode
End Function
Function GetRight()
    Return RightNode
End Function
Function GetData()
    Return NodeData
End Function
```

#### Java

```
public Integer GetData(){
    return NodeData;
}
public Node GetLeft(){
    return LeftNode;
}
public Node GetRight(){
    return RightNode;
}
```

Question	Answer	Marks
3(a)(iii)	<p>1 mark each</p> <ul style="list-style-type: none"> <li>• 1 set method taking parameter of type Node ...</li> <li>• ... assigning to correct attribute</li> <li>• 2nd correct set method</li> </ul>	<b>3</b>
<p>Example program code:</p> <p><b>Python</b></p> <pre>def SetLeft(self, NewNode):     self._LeftNode = NewNode def SetRight(self, NewNode):     self._RightNode = NewNode</pre> <p><b>VB.NET</b></p> <pre>Sub SetLeft(NewNode)     LeftNode = NewNode End Sub Sub SetRight(NewNode)     RightNode = NewNode End Sub</pre> <p><b>Java</b></p> <pre>public void SetLeft(Node NewNode){     LeftNode = NewNode; } public void SetRight(Node NewNode){     RightNode = NewNode; }</pre>		

Question	Answer	Marks
3(b)	<p>1 mark each</p> <ul style="list-style-type: none"> <li>• Creating 1 instance of Node with a correct value and storing the node ...</li> <li>• ... remaining 4 correct</li> </ul>	2
<p>Example program code:</p> <p><b>Python</b></p> <pre>FirstNode = Node(10) SecondNode = Node(20) ThirdNode = Node(5) FourthNode = Node(15) FifthNode = Node(7)</pre> <p><b>VB.NET</b></p> <pre>Dim FirstNode As Node = New Node(10) Dim SecondNode As Node = New Node(20) Dim ThirdNode As Node = New Node(5) Dim FourthNode As Node = New Node(15) Dim FifthNode As Node = New Node(7)</pre> <p><b>Java</b></p> <pre>Node FirstNode = new Node(10); Node SecondNode = new Node(20); Node ThirdNode = new Node(5); Node FourthNode = new Node(15); Node FifthNode = new Node(7);</pre>
