Paper 3 Advanced Theory

For examination from 2021

SPECIMEN PAPER

1 hour 30 minutes

You must answer on the question paper.

No additional materials are needed.

### **INSTRUCTIONS**

- Answer all questions.
- Use a black or dark blue pen.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do not use an erasable pen or correction fluid.
- Do not write on any bar codes.
- You may use an HB pencil for any diagrams, graphs or rough working.
- Calculators must not be used in this paper.

### INFORMATION

- The total mark for this paper is 75.
- The number of marks for each question or part question is shown in brackets [ ].
- No marks will be awarded for using brand names of software packages or hardware.

This document has **16** pages. Blank pages are indicated.

© UCLES 2018 [Turn over

- 1 In a particular computer system, real numbers are stored using floating-point representation with:
  - 12 bits for the mantissa
  - 4 bits for the exponent
  - two's complement form for both mantissa and exponent.
  - (a) Calculate the normalised floating-point representation of +4.5 in this system. Show your working.

[3]

| (b) | BitT  | forrent is a protocol used at the Application layer for the exchange of data. |
|-----|-------|---|
|     | (i)   | State the network model used with this protocol.                              |
|     |       | [1]   |
|     | (ii)  | State the use of BitTorrent.  |
|     |       | [1]   |
|     |       | [1]   |
|     | (iii) | Explain how applications use BitTorrent to exchange data.                     |
|     |       |   |
|     |       |   |
|     |       |   |
|     |       |   |
|     |       |   |
|     |       |   |
|     |       |   |
|     |       |   |
|     |       |   |
|     |       |   |
|     |       |   |

| (c) | State <b>two</b> other protocols that are used at the Application layer for the exchange of data. |
|-----|---|
|     | For each protocol, give a different example of an appropriate exchange of data.                   |
|     | Protocol 1  |
|     | Example   |
|     |   |
|     | Protocol 2  |
|     | Example   |
|     | [4]   |

3 (a) Complete the Boolean expession that corresponds to the following truth table.

|   | INPUT |   | OUTPUT |
|---|-------|---|--------|
| Α | В     | С | Х      |
| 0 | 0     | 0 | 0      |
| 0 | 0     | 1 | 0      |
| 0 | 1     | 0 | 0      |
| 0 | 1     | 1 | 1      |
| 1 | 0     | 0 | 0      |
| 1 | 0     | 1 | 0      |
| 1 | 1     | 0 | 1      |
| 1 | 1     | 1 | 1      |

$$X = \overline{A} \cdot B \cdot C$$
 [2]

The part to the right of the equals sign is known as the sum-of-products.

(b) (i) Complete the Karnaugh map (K-map) for the truth table given in part (a).

|   |   |    | Α  | В  |    |
|---|---|----|----|----|----|
|   |   | 00 | 01 | 11 | 10 |
| С | 0 |    |    |    |    |
| C | 1 |    |    |    |    |

[1]

The K-map can be used to simplify the function in part (a).

- (ii) Draw loop(s) around appropriate groups of 1s to produce an optimal sum-of-products. [2]
- (iii) Using your answer to **part** (b)(ii), write the simplified sum-of-products Boolean expression.

|     |               | nt writes a program in a high-level programming language. A compiler translates the into machine code.   |
|-----|---------------|--|
| (a) | The           | compilation process has a number of stages.  |
|     | The           | output of the lexical analysis stage forms the input to the next stage.  |
|     | (i)           | Identify this stage.   |
|     |               | [1]  |
|     | (ii)          | State <b>two</b> tasks that occur at this stage.   |

$$X \leftarrow A + B$$
  
 $Y \leftarrow A + B + C$ 

Following the syntax analysis stage, object code is generated. The equivalent code, in assembly language, is shown below:

| 01 | LDD | 436 | //loads value A    |   |
|----|-----|-----|--------------------|---|
| 02 | ADD | 437 | //adds value B     |   |
| 03 | STO | 612 | //stores result in | Х |
| 04 | LDD | 436 | //loads value A    |   |
| 05 | ADD | 437 | //adds value B     |   |
| 06 | ADD | 438 | //adds value C     |   |
| 07 | STO | 613 | //stores result in | Υ |
|    |     |     |                    |   |

Suggest what a compiler could do to optimise this code.

[4]

- 7 An ordered binary tree Abstract Data Type (ADT) has these associated operations:
  - create tree
  - add new item to tree
  - traverse tree

A student is designing a program that will implement a binary tree ADT as a linked list of **ten** nodes.

Each node consists of data, a left pointer and a right pointer.

A program is to be written to implement the tree ADT. The variables and procedures to be used are listed below:

| Identifier           | Data type | Description   |
|----------------------|-----------|---|
| Node                 | RECORD    | Data structure to store node data and associated pointers.  |
| LeftPointer          | INTEGER   | Stores index of start of left subtree.  |
| RightPointer         | INTEGER   | Stores index of start of right subtree.   |
| Data                 | STRING    | Data item stored in node.   |
| Tree                 | ARRAY     | Array to store nodes.   |
| NewDataItem          | STRING    | Stores data to be added.  |
| FreePointer          | INTEGER   | Stores index of start of free list.   |
| RootPointer          | INTEGER   | Stores index of root node.  |
| NewNodePointer       | INTEGER   | Stores index of node to be added.   |
| CreateTree()         |           | Procedure initialises the root pointer and free pointer and links all nodes together into the free list.  |
| AddToTree()          |           | Procedure to add a new data item in the correct position in the binary tree.  |
| FindInsertionPoint() |           | Procedure that finds the node where a new node is to be added.  Procedure takes the parameter NewDataItem and returns two parameters:  Index, whose value is the index of the node where the new node is to be added  Direction, whose value is the direction of the pointer ("Left" or "Right"). |

These pseudocode declarations and this procedure can be used to create an empty tree with ten nodes.

```
TYPE Node
   DECLARE LeftPointer : INTEGER
   DECLARE RightPointer: INTEGER
   DECLARE Data : STRING
ENDTYPE
DECLARE Tree : ARRAY[0 : 9] OF Node
DECLARE FreePointer : INTEGER
DECLARE RootPointer: INTEGER
PROCEDURE CreateTree()
   DECLARE Index : INTEGER
   RootPointer \leftarrow -1
   FreePointer \leftarrow 0
   FOR Index \leftarrow 0 TO 9 // link nodes
       Tree[Index].LeftPointer \leftarrow Index + 1
       Tree[Index].RightPointer \leftarrow -1
   Tree[9].LeftPointer \leftarrow -1
ENDPROCEDURE
```

## (a) Complete the pseudocode to add a data item to the tree.

```
PROCEDURE AddToTree (BYVALUE NewDataItem : STRING)
// if no free node report an error
  IF FreePointer .....
       OUTPUT "No free space left"
    ELSE
       // add new data item to first node in the free list
       NewNodePointer ← FreePointer
       .....
       // adjust free pointer
       FreePointer ← .....
       // clear left pointer
       Tree[NewNodePointer].LeftPointer ← .....
       // is tree currently empty?
       IF .....
         THEN // make new node the root node
           .....
         ELSE // find position where new node is to be added
           Index ← RootPointer
           CALL FindInsertionPoint (NewDataItem, Index, Direction)
           IF Direction = "Left"
              THEN // add new node on left
                .....
              ELSE // add new node on right
                .....
           ENDIF
       ENDIF
   ENDIF
                                             [8]
ENDPROCEDURE
```

| (b) | The traverse tree operation outputs the data items in alphabetical order. This can be written as a recursive solution.  Complete the pseudocode for the recursive procedure TraverseTree. |  |  |  |  |  |  |
|-----|---|--|--|--|--|--|--|
|     |   |  |  |  |  |  |  |
|     | PROCEDURE TraverseTree(BYVALUE Pointer : INTEGER)   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     |   |  |  |  |  |  |  |
|     | ENDPROCEDURE [5]  |  |  |  |  |  |  |

© UCLES 2018 9618/03/SP/21 8 The table shows assembly language instructions for a processor that has one general purpose register, the Accumulator (ACC).

| Instru | ıction                | Explanation   |  |
|--------|-----------------------|---|--|
| Opcode | Operand               |   |  |
| LDM    | #n                    | Load the denary number n to ACC   |  |
| LDD    | <address></address>   | Load the contents of the given address to ACC   |  |
| STO    | <address></address>   | Store the contents of ACC at the given address  |  |
| ADD    | <address></address>   | Add the contents of the given address to the ACC                                      |  |
| INC    | <register></register> | Add 1 to the contents of the register   |  |
| CMP    | <address></address>   | Compare the contents of ACC with the contents of <address></address>                  |  |
| JPN    | <address></address>   | Following a compare instruction, jump to <address> if the compare was False</address> |  |
| END    |                       | Return control to the operating system  |  |
