Fig. 10 for Question 7 (continued)
Instructions on how to estimate the amount of sky which can be seen through the measuring device
The measuring device is made up of clear plastic viewing screen which is surrounded by a dark frame to make the viewing area clearer. The viewing screen is divided into 100 equally sized squares. Each square equals $1 \%$. It is used in the same way as a quadrat.

Stage 1. Hold the measuring device above your head and look vertically up to the sky.
Stage 2. Count or estimate how many squares through which it is possible to see the sky.
Stage 3. To check your result count or estimate in how many squares the sky is hidden by tree cover.
Stage 4. The total number of squares estimated or counted in stages 2 and 3 must add up to 100 .
Stage 5. Record your percentage result for the sky (stage 2) in the table.
