18 (c)	Choice with justification **(1)** e.g. 'yes it's reasonable as clove oil may be in use at harmful /toxic levels so we need to identify what that **level** is' 'no as clove oil has been in use for many years in many ways so tests on animals not necessary to confirm it's safe to use at current levels' / no, as humans would have to consume large amounts	Yes because it's toxic No, because of objections to animal testing in general	**1**

Question Number	Acceptable Answers	Reject	Mark
18 (d)*	**4 clear justified comparisons – 1 mark each** **ScCO$_2$** oil obtained seems **purer** (as colour closely matches that of eugenol) requires no further purification, (others use solvent extraction) greater yield per hour yield 15.3g per 100g of buds no organic solvent (because it is chlorinated) **and** so environmental problems / harmful / damage ozone layer requires high pressure so likely to be expensive / requires specialist equipment **Steam distillation** steam distillation can be done using standard lab equipment /does not require high pressures yield only 6.1g / 6.2g per 100g of buds Steam gives the least yield per hour **Soxhlet** produces greater yield of oil but has a smaller percentage of eugenol /eugenol ethanoate yield 16.8g per 100g of buds (takes longer) but does not require high pressures uses organic solvent (because it is chlorinated) **and** so environmental problems / harmful / damage ozone layer Oil obtained seems least pure (4) **Synthetic route** has several steps, each with a low yield clove buds are renewable but materials in synthesis are not / materials in synthesis likely to be obtained from oil (1)	produces pale yellow oil Just no organic solvent Only two hours / shorter time than other methods Just higher percentage yield Just no organic solvent Higher yield than soxhlet Cost of chemicals Yield is 35 %	5
