Total Marks

## Instructions

- Use **black** ink or **black** ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided  
– *there may be more space than you need.*

## Information

- The total mark for this paper is 90.
- The marks for **each** question are shown in brackets  
– *use this as a guide as to how much time to spend on each question.*
- For the question marked with an asterisk (\*), marks will be awarded for your ability to structure your answer logically showing the points that you make are related or follow on from each other where appropriate.
- A Periodic Table is printed on the back cover of this paper.

## Advice

- Read each question carefully before you start to answer it.
- Show your working in calculations and include units where appropriate.
- Check your answers if you have time at the end.

Pearson

## SECTION A

Answer ALL the questions in this section. You should aim to spend no more than 20 minutes on this section. For each question, select one answer from A to D and put a cross in the box . If you change your mind, put a line through the box  and then mark your new answer with a cross .

- 1 The enthalpy change of hydrogenation of cyclohexene is  $-120 \text{ kJ mol}^{-1}$ .

What is the approximate enthalpy change of hydrogenation of benzene, in  $\text{kJ mol}^{-1}$ ?

- A  $-150$   
 B  $-210$   
 C  $-360$   
 D  $-510$

(Total for Question 1 = 1 mark)

- 2 Which orbitals overlap to form the ring of delocalised electrons in benzene and what type of bond is formed?

	Orbitals overlapping	Type of bond
<input type="checkbox"/> A	p	$\pi$
<input type="checkbox"/> B	p	$\sigma$
<input type="checkbox"/> C	s and p	$\pi$
<input type="checkbox"/> D	s and p	$\sigma$

(Total for Question 2 = 1 mark)

Use this space for any rough working. Anything you write in this space will gain no credit.

3 Which reagent and catalyst will convert benzene into phenylethanone?

	Reagent	Catalyst
<input type="checkbox"/> A	ethanal	aluminium chloride
<input type="checkbox"/> B	ethanal	platinum
<input type="checkbox"/> C	ethanoyl chloride	aluminium chloride
<input type="checkbox"/> D	ethanoyl chloride	platinum

(Total for Question 3 = 1 mark)

4 Chlorine reacts with methylbenzene in the presence of ultraviolet light.

Which of these is a product of this reaction?

<input type="checkbox"/> A		<input type="checkbox"/> B	
<input type="checkbox"/> C		<input type="checkbox"/> D	

(Total for Question 4 = 1 mark)

Use this space for any rough working. Anything you write in this space will gain no credit.

5 How many isomers containing a benzene ring are there with the molecular formula  $C_6H_3(NO_2)_2OH$ ?

- A 4  
 B 5  
 C 6  
 D 7

(Total for Question 5 = 1 mark)

6 Phenol reacts with ethanoyl chloride to form phenyl ethanoate.

In an experiment, 3.67 g of phenyl ethanoate was formed, giving a yield of 85.0%.

What was the starting mass of phenol?

- A 2.16 g  
 B 2.54 g  
 C 2.98 g  
 D 4.51 g

(Total for Question 6 = 1 mark)

Use this space for any rough working. Anything you write in this space will gain no credit.

7 A hydrocarbon contains 91.3 % by mass of carbon.

Which of these could be the molecular formula of this compound?

- A  $C_6H_6$   
 B  $C_7H_8$   
 C  $C_8H_{10}$   
 D  $C_9H_{12}$

(Total for Question 7 = 1 mark)

8 What is an organic product of the reaction between ethylamine and chloroethane?

- A  $NH_2CH_2COCl$   
 B  $C_2H_5NH_4^+Cl^-$   
 C  $C_2H_5NHCOC_2H_5$   
 D  $(C_2H_5)_2NH_2^+Cl^-$

(Total for Question 8 = 1 mark)

9 Which pair of monomers can form this polymer?

	Monomer 1	Monomer 2
<input type="checkbox"/> A	$HOC_6H_4OH$	$HOOCCH_2CH_2COOH$
<input type="checkbox"/> B	$HOCH_2C_6H_4CH_2OH$	$HOOCCH_2CH_2COOH$
<input type="checkbox"/> C	$HOCH_2C_6H_4COOH$	$HOCH_2CH_2COOH$
<input type="checkbox"/> D	$HOCC_6H_4COOH$	$HOCH_2CH_2OH$

(Total for Question 9 = 1 mark)

Use this space for any rough working. Anything you write in this space will gain no credit.

10 Part of the structure of a protein is shown.

How many **different** amino acids were used to form this part of the structure?

- A 3
- B 4
- C 5
- D 6

(Total for Question 10 = 1 mark)

11 Which organic compound reacts with a Grignard reagent to give a product that forms a secondary alcohol on hydrolysis?

- A carbon dioxide
- B ethanal
- C methanal
- D propanone

(Total for Question 11 = 1 mark)

Use this space for any rough working. Anything you write in this space will gain no credit.

12 A compound with the formula  $C_6H_{14}$  gives a  $^{13}C$  NMR spectrum with four peaks.

Which compound gives this spectrum?

A

B

C

D

(Total for Question 12 = 1 mark)

13 Cuminone is used as a flavouring.

cuminone

What is the molecular formula of cuminone?

A  $C_{10}H_{13}O$

B  $C_{10}H_{15}O$

C  $C_{11}H_{14}O$

D  $C_{11}H_{16}O$

(Total for Question 13 = 1 mark)

Use this space for any rough working. Anything you write in this space will gain no credit.

14 Which species contains an element with the same oxidation number as bromine in  $\text{KBrO}_3$ ?

- A  $\text{N}_2\text{O}_5$   
 B  $\text{KMnO}_4$   
 C  $\text{K}_2\text{FeO}_4$   
 D  $\text{Na}_2\text{SO}_3$

(Total for Question 14 = 1 mark)

15 Which is a redox reaction?

- A  $\text{Cr}_2\text{O}_7^{2-} + 2\text{C} \rightarrow \text{Cr}_2\text{O}_3 + \text{CO}_3^{2-} + \text{CO}$   
 B  $\text{CrO}_2\text{Cl}_2 + 4\text{OH}^- \rightarrow \text{CrO}_4^{2-} + 2\text{Cl}^- + 2\text{H}_2\text{O}$   
 C  $\text{Cr}_2\text{O}_7^{2-} + 2\text{HCl} \rightarrow 2\text{CrO}_3\text{Cl}^- + \text{H}_2\text{O}$   
 D  $2\text{CrO}_4^{2-} + 2\text{H}^+ \rightarrow \text{Cr}_2\text{O}_7^{2-} + \text{H}_2\text{O}$

(Total for Question 15 = 1 mark)

16 The electronic configuration of the atoms of an element is  $1s^2 2s^2 2p^6 3s^2 3p^6 3d^5 4s^1$ .

What is the maximum oxidation number shown in compounds of this element?

- A +1  
 B +5  
 C +6  
 D +7

(Total for Question 16 = 1 mark)

17 Which of the following species will **not** act as a ligand in the formation of a complex ion?

- A  $\text{CH}_3\text{NH}_2$   
 B  $\text{CN}^-$   
 C  $\text{NH}_3$   
 D  $\text{NH}_4^+$

(Total for Question 17 = 1 mark)

- 18 What is the coordination number of the nickel(II) ion and the overall charge,  $m$ , of this complex?

	Coordination number of nickel(II) ion	Overall charge, $m$ , of this complex
<input type="checkbox"/> A	2	0
<input type="checkbox"/> B	2	4-
<input type="checkbox"/> C	6	0
<input type="checkbox"/> D	6	4-

(Total for Question 18 = 1 mark)

- 19 In acidic conditions, manganate(VII) ions are reduced to manganese(II) ions,  $\text{Mn}^{2+}$ .

In neutral conditions, manganate(VII) ions are reduced to manganese(IV) oxide,  $\text{MnO}_2$ .

22.0  $\text{cm}^3$  of a solution of manganate(VII) ions were needed to oxidise 25.0  $\text{cm}^3$  of a solution of iron(II) ions to iron(III) ions in **acidic** conditions.

The same solution of manganate(VII) ions is used to oxidise 25.0  $\text{cm}^3$  of the same solution of iron(II) ions in **neutral** conditions.

By considering the oxidation number changes involved, it may be shown that the volume of the manganate(VII) solution required, in neutral conditions, is

- A 12.6  $\text{cm}^3$
- B 13.2  $\text{cm}^3$
- C 36.7  $\text{cm}^3$
- D 38.5  $\text{cm}^3$

(Total for Question 19 = 1 mark)

**20** A solution contains  $19.6 \text{ g dm}^{-3}$  of chromium(III) sulfate,  $\text{Cr}_2(\text{SO}_4)_3$ .

What is the concentration, in  $\text{mol dm}^{-3}$ , of sulfate ions in this solution?

[Molar mass  $\text{Cr}_2(\text{SO}_4)_3 = 392 \text{ g mol}^{-1}$ ]

- A** 0.05
- B** 0.10
- C** 0.15
- D** 0.25

## SECTION B

Answer ALL the questions. Write your answers in the spaces provided.

21 This question is about electrochemical cells.

(a) The half-equation for an iron(III) / iron(II) half-cell is

The standard electrode potential of this half-cell is measured using the apparatus shown.

The measurement is made under standard conditions.

Identify, by name or formula, the substances needed in the salt bridge and in the right-hand half-cell to measure the standard electrode potential.

(3)

**A** Salt bridge containing a solution of

.....

**B** Electrode made of

.....

**C** Solution containing

.....

(b) The cell diagram for an electrochemical cell is

Write the half-equations for the two half-cells and hence the overall ionic equation for the reaction that occurs.

State symbols are not required.

(3)

(c) The standard electrode potential,  $E^\ominus$ , for the chromium(III) / chromium half-cell is  $-0.74$  V.

The effect on the electrode potential,  $E$ , of changing the concentration of the ions in the half cell is calculated using the equation

$$E = E^\ominus + \frac{RT}{96\,500 \times n} \ln[\text{Cr}^{3+}(\text{aq})]$$

where  $n$  is the number of electrons in the half-equation,  $T$  is the temperature in kelvin and  $R$  is the gas constant.

Calculate the electrode potential of the half-cell at 298 K when the concentration of chromium(III) ions is  $0.0100 \text{ mol dm}^{-3}$ .

### The Lanthanides

The lanthanides form a series in the Periodic Table comprising the elements from lanthanum, La ( $Z = 57$ ) to lutetium, Lu ( $Z = 71$ ). They have important uses as elements and compounds, for example, in the screens, circuits and speakers of smartphones. These elements have some similar properties to d-block elements.

Many of the lanthanide elements are obtained by heating their trichlorides or trifluorides with calcium at  $1000^{\circ}\text{C}$ .

These elements form part of the f-block of the Periodic Table as the last electron added enters an f-orbital. There are seven f-orbitals in the f-subshell.

The electronic configurations of the atoms consist of the electronic configuration of xenon followed by electrons in the 4f and 6s orbitals and sometimes the 5d orbitals. For example:

samarium, Sm	$[\text{Xe}]4f^66s^2$
europium, Eu	$[\text{Xe}]4f^76s^2$
gadolinium, Gd	$[\text{Xe}]4f^75d^16s^2$
terbium, Tb	$[\text{Xe}]4f^96s^2$

All of the lanthanides form ions with a charge of  $3+$  and the ionic radii of these ions decrease as the atomic number of the element increases.

The lanthanides form complex ions, for example,  $[\text{Ce}(\text{H}_2\text{O})_9]^{3+}$  and  $[\text{Yb}(\text{H}_2\text{O})_8]^{3+}$ .

Many of the complex ions formed from the elements in the lanthanide series are coloured and this colour is caused by f–f transitions.

Cerium(IV) ammonium nitrate is yellow in aqueous solution and gives a red colour with **all** alcohols.

Cerium(IV) ammonium sulfate is used in redox titrations with ferroin as the indicator. The colour change is red to yellow.

Use your knowledge of d-block elements to help you to answer the questions.

- (f) The amount of paracetamol in a tablet can be determined using a titration with cerium(IV) ions.

The tablets are crushed and then hydrolysed in acid to form 4-aminophenol.

4-aminophenol is oxidised by cerium(IV) ions.

Outline procedure

- Two tablets containing paracetamol were crushed and 0.800 g of the powder was added to dilute sulfuric acid.
- The mixture was heated under reflux until the hydrolysis was complete.
- The solution was made up to 100.0 cm<sup>3</sup> in a volumetric flask.
- 25.0 cm<sup>3</sup> portions of the solution were titrated against acidified 0.100 mol dm<sup>-3</sup> Ce<sup>4+</sup> using ferroin the indicator.

Result

The mean titre was 21.70 cm<sup>3</sup>.

Calculate the percentage by mass of paracetamol in the tablets.  
Give your answer to an appropriate number of significant figures.
