

4.

Figure 3

A container is formed by removing a right circular solid cone of height $4l$ from a uniform solid right circular cylinder of height $6l$. The centre O of the plane face of the cone coincides with the centre of a plane face of the cylinder and the axis of the cone coincides with the axis of the cylinder, as shown in Figure 3. The cylinder has radius $2l$ and the base of the cone has radius l .

(a) Find the distance of the centre of mass of the container from O .

(6)

Figure 4

The container is placed on a plane which is inclined at an angle θ° to the horizontal. The open face is uppermost, as shown in Figure 4. The plane is sufficiently rough to prevent the container from sliding. The container is on the point of toppling.

(b) Find the value of θ .

(4)

5.

Figure 5

A particle P of mass m is attached to one end of a light inextensible string of length a . The other end of the string is fixed at the point O . The particle is initially held with OP horizontal and the string taut. It is then projected vertically upwards with speed u , where $u^2 = 5ag$. When OP has turned through an angle θ the speed of P is v and the tension in the string is T , as shown in Figure 5.

- (a) Find, in terms of a , g and θ , an expression for v^2 . (3)
- (b) Find, in terms of m , g and θ , an expression for T . (4)
- (c) Prove that P moves in a complete circle. (3)
- (d) Find the maximum speed of P . (2)
